

# Package ‘MF’

January 16, 2026

**Type** Package

**Title** Mitigated Fraction

**Version** 4.4.11

**Date** 2024-07-25

**Description** Calculate MF (mitigated fraction) with clustering and bootstrap options. See <http://goo.gl/pcXYVr> for definition of MF. No endorsement, claim, or warranty is implied for this package. It is made available for investigational or pedagogical use only.

**License** file LICENSE

**URL** <https://github.com/ABS-dev/MF/>, <https://abs-dev.github.io/MF/>

**BugReports** <https://github.com/ABS-dev/MF/issues/>

**LazyLoad** true

**LazyData** true

**Depends** R (>= 4.2)

**Imports** methods,  
dplyr (>= 0.7.1),  
plyr,  
stringr,  
tidyR (>= 1.3.0),  
forcats,  
purrr,  
rlang (>= 1.1.1)

**Suggests** rmarkdown,  
tidyverse,  
kableExtra,  
testthat,  
covr,  
knitr,  
R.rsp

**Collate** 'aaa.r'  
'classes.r'  
'generic\_methods.r'  
'MF.r'  
'MF-package.r'  
'HLBoot.r'

'MFBoot.r'  
 'MFClus.r'  
 'MFClusBoot.r'  
 'MFClusHier.r'  
 'MFmp.r'  
 'MFnestBoot.r'  
 'MFr.r'  
 'MFSbj.r'  
 'MFHier-wrappers.r'

**Encoding** UTF-8

**Roxygen** list(markdown = TRUE)

**RoxygenNote** 7.3.2

**VignetteBuilder** R\_rsp

## Index

---

calflungcalflung dataset

---

**Description**

Post-mortem examination of the lungs of groups of calves.

**Format**

a data frame with 50 observations of the following 2 variables, no NAs

- group: Treatment group. One of con = control or vac = vaccinate
- lesion: Fraction of lungs with gross lesions.

---

HLBootBootstrap CI for MF, HL, and Qdif

---

**Description**

Estimates bootstrap confidence intervals for MF, HL, and Qdif.

**Usage**

```
HLBoot(
  formula,
  data,
  compare = c("con", "vac"),
  b = 100,
  B = 100,
  alpha = 0.05,
  hpd = TRUE,
  bca = FALSE,
  return.boot = FALSE,
  trace.it = FALSE,
  seed = sample(1:1e+05, 1)
)
```

**Arguments**

formula	Formula of the form $y \sim x + \text{cluster}(w)$ , where $y$ is a continuous response, $x$ is a factor with two levels of treatment, and $w$ is a factor indicating the clusters.
data	Data frame
compare	Text vector stating the factor levels - compare[1] is the control or reference group to which compare[2] is compared
b	Number of bootstrap samples to take with each cycle
B	Number of cycles, giving the total number of samples = $B * b$
alpha	Complement of the confidence level
hpd	Boolean whether to estimate highest density intervals for MF and HL.

bca	Boolean whether to estimate BCa intervals for MF.
return.boot	Boolean whether to save the bootstrap samples of the statistics.
trace.it	Boolean whether to display verbose tracking of the cycles.
seed	to initialize random number generator for reproducibility. Passed to <code>set.seed</code> .

## Details

Estimates bootstrap confidence intervals for the mitigated fraction (MF), Hodge-Lehmann estimator (HL), and the difference of medians and quartiles (Qdif). Equal tailed intervals are provided for all three, highest density intervals are optionally provided for MF and HL, and BCa intervals are optionally provided for MF. The Hodges-Lehmann estimator is the median difference; it assumes that the two distributions have the same shape and differ by a constant shift. Assumes data is single pool (no nesting).

## Value

a [mfhlboot](#) data object

## Author(s)

[MF-package](#)

**mf-class***Class mf***Description**

Parent class for package MF data objects.

**Fields**

- nboot: numeric value specifying number of samples
- alpha: numeric value specifying complement of confidence interval
- seed: vector of integers specifying seed for pseudo-random number generator used
- compare: vector of character strings naming groups compared
- rng: character string naming type of random number generator

**Author(s)**

[MF-package](#)

**See Also**

Other mf: [mfboot-class](#), [mfbootcluster-class](#), [mfhlboot-class](#)

**MFBoot***Bootstrap MF CI***Description**

Estimates bootstrap confidence intervals for the mitigated fraction.

**Usage**

```
MFBoot(
  formula,
  data,
  compare = c("con", "vac"),
  b = 100,
  B = 100,
  alpha = 0.05,
  hpd = TRUE,
  bca = FALSE,
  return.boot = FALSE,
  trace.it = FALSE,
  seed = sample(1:1e+05, 1)
)
```

**Arguments**

<code>formula</code>	Formula of the form $y \sim x$ , where $y$ is a continuous response and $x$ is a factor with two levels.
<code>data</code>	Data frame
<code>compare</code>	Text vector stating the factor levels - <code>compare[1]</code> is the control or reference group to which <code>compare[2]</code> is compared
<code>b</code>	Number of bootstrap samples to take with each cycle
<code>B</code>	Number of cycles, giving the total number of samples = $B * b$
<code>alpha</code>	Complement of the confidence level
<code>hpd</code>	Estimate highest density intervals?
<code>bca</code>	Estimate BCa intervals?
<code>return.boot</code>	Save the bootstrap sample of the MF statistic?
<code>trace.it</code>	Verbose tracking of the cycles?
<code>seed</code>	to initialize random number generator for reproducibility. Passed to <code>set.seed</code> .

**Details**

Resamples the data and produces bootstrap confidence intervals. Equal tailed intervals are estimated by the percentile method. Highest density intervals are estimated by selecting the shortest of all possible intervals. For BCa intervals, see Efron and Tibshirani section 14.3.

**Value**

a `mfboot` data object

```
MFBoot(lesion ~ group, calflung, seed = 12345)

# 10000 bootstrap samples
# 95% confidence interval
# Seed = 12345
#
# Comparing vac to con
# observed median lower upper
# Equal Tailed      0.44 0.4496 0.152 0.7088
# Highest Density   0.44 0.4496 0.152 0.7088
```

---

**mfboot-class***Class mfboot*

---

**Description**

class for data objects produced by MFBoot, contains class mf with the two additional fields *stat* and *stuff*.

**Fields**

- nboot: numeric value specifying number of samples
- alpha: numeric value specifying complement of confidence interval
- seed: vector of integers specifying seed for pseudo-random number generator used
- compare: vector of character strings naming groups compared
- rng: character string naming type of random number generator
- sample: what is this?
- stat: matrix of estimates

**Contains**[mf](#)**Author(s)**[MF-package](#)

**See Also**[MFBoot](#)Other mf: [mf-class](#), [mfbootcluster-class](#), [mfhlboot-class](#)**mfbootcluster-class**     *Class mfbootcluster***Description**

Class mfbootcluster is created from output of function MFClusBoot

**Fields**

- nboot: numeric value specifying number of samples
- alpha: numeric value specifying complement of confidence interval
- seed: vector of integers specifying seed for pseudo-random number generator used
- compare: vector of character strings naming groups compared
- rng: character string naming type of random number generator
- stat: matrix matrix with columns *observed*, *median*, *lower*, *upper* for estimates
- what: character vector naming what was resampled: *clusters*, *units*, *both*
- excludedClusters: character vector naming clusters excluded because of missing treatment(s)
- call: the call to MFClusBoot
- sample: what is this?
- All: Field "All" from MFClus call.

---

MFClus	<i>Clustered mitigated fraction</i>
--------	-------------------------------------

---

## Description

Estimates mitigated fraction from clustered or stratified data.

## Usage

```
MFClus(formula, data, compare = c("con", "vac"), trace.it = FALSE)
```

## Arguments

formula	Formula of the form $y \sim x + \text{cluster}(w)$ , where $y$ is a continuous response, $x$ is a factor with two levels of treatment, and $w$ is a factor indicating the clusters.
data	Data frame. See Note for handling of input data with more than two levels.
compare	Text vector stating the factor levels - compare[1] is the control or reference group to which compare[2] is compared
trace.it	Verbose tracking of the cycles? Default FALSE.

## Details

Averages the U statistic over the clusters and computes MF from it. Clusters are excluded if they do not include both treatments.

## Value

a [mfcluster](#) data object

## Note

If input data contains more than two levels of treatment, rows associated with unused treatment levels will be removed.

Factor levels for treatments not present in the input data will be ignored.

Clusters with missing treatments will be excluded. See [mfbootcluster](#) or use `trace.it` to identify excluded clusters.

## Author(s)

MFClusBoot

Bootstrap MF CI from clustered data

## Description

Estimates bootstrap confidence intervals for the mitigated fraction from clustered or stratified data.

## Usage

```

MFClusBoot(
  formula,
  data,
  compare = c("con", "vac"),
  boot.cluster = TRUE,
  boot.unit = TRUE,

```

```

b = 100,
B = 100,
alpha = 0.05,
hpd = TRUE,
return.boot = FALSE,
trace.it = FALSE,
seed = sample(1:1e+05, 1)
)

```

## Arguments

formula	Formula of the form $y \sim x + \text{cluster}(w)$ , where $y$ is a continuous response, $x$ is a factor with two levels of treatment, and $w$ is a factor indicating the clusters.
data	Data frame. See Note for handling of input data with more than two levels.
compare	Text vector stating the factor levels - compare[1] is the control or reference group to which compare[2] is compared
boot.cluster	Boolean whether to resample the clusters.
boot.unit	Boolean whether to resample the units within cluster.
b	Number of bootstrap samples to take with each cycle
B	Number of cycles, giving the total number of samples = $B * b$
alpha	Complement of the confidence level
hpd	Boolean whether to estimate highest density intervals.
return.boot	Boolean whether to save the bootstrap sample of the MF statistic.
trace.it	Boolean whether to display verbose tracking of the cycles.
seed	to initialize random number generator for reproducibility. Passed to <code>set.seed</code> .

## Details

Resamples the data and produces bootstrap confidence intervals. Equal tailed intervals are estimated by the percentile method. Highest density intervals are estimated by selecting the shortest of all possible intervals.

## Value

a `mfbootcluster` data object

## Note

If input data contains more than two levels of treatment, rows associated with unused treatment levels will be removed.

Factor levels for treatments not present in the input data will be ignored.

Clusters with missing treatments will be excluded. See `mfbootcluster` or use `trace.it` to identify excluded clusters.

## Author(s)

[MF-package](#)

## Examples

```
## Not run:
MFClusBoot(lesion ~ group + cluster(litter), piglung, seed = 12345)
# Bootstrapping clusters. . . . . .
#
# Bootstrapping units. . . . . .
#
# 10000 bootstrap samples of clusters and units in treatment in cluster
# Comparing vac to con
#
# 95% confidence interval
#
# observed      median      lower      upper
# Equal Tailed  0.3533835 0.3648649 -0.01409471 0.7109966
# Highest Density 0.3533835 0.3648649  0.00000000 0.7236842
#
# Excluded Clusters
# M, Q, R, B, O, V, I, C

## End(Not run)
```

## Description

Combines [MFhBoot](#) and [MFnestBoot](#) into a single function.

## Usage

```
MFClusBootHier(
  formula,
  data,
  compare = c("con", "vac"),
  nboot = 10000,
  boot.unit = TRUE,
  boot.cluster = TRUE,
  which.factor = "All",
  alpha = 0.05,
  seed = sample(1:1e+05, 1)
)
```

### Arguments

formula	Formula of the form $y \sim x + a/b/c$ , where $y$ is a continuous response, $x$ is a factor with two levels of treatment, and $a/b/c$ are grouping variables corresponding to the clusters. Nesting is assumed to be in order, left to right, highest to lowest. So a single level of "a" will contain multiple levels of "b" and a single level of "b" will contain multiple levels of "c".
data	a data.frame or tibble with the variables specified in formula. Additional variables will be ignored.
compare	Text vector stating the factor levels - compare[1] is the control or reference group to which compare[2] is compared.
nboot	number of bootstrapping events
boot.unit	Boolean whether to sample observations from within those of the same core.
boot.cluster	Boolean whether to sample which cores are present. If TRUE, some trees have all the cores while others only have a subset.
which.factor	Which variables to include in the mitigated fraction summation. Default is "All", to sum over entire tree.
alpha	Passed to emp_hpd to calculate high tailed upper and high tailed lower of mitigated fraction.
seed	Passed to <a href="#">MFhBoot</a> to initialize random number generator for reproducibility.

### Value

A list with the following elements:

- MFhBoot: as output from [MFhBoot](#).
- MFnestBoot: as output from [MFnestBoot](#).

### Note

Core variable is the variable corresponding to the lowest nodes of the hierarchical tree. Nest variables are those above the core. All refers to a summary of the entire tree.

### Author(s)

[MF-package](#)

### See Also

[MFhBoot](#), [MFnestBoot](#).

### Examples

```
a <- data.frame(
  room = paste("Room", rep(c("W", "Z"), each = 24)),
  pen = paste("Pen", rep(LETTERS[1:6], each = 8)),
  litter = paste("Litter", rep(11:22, each = 4)),
  tx = rep(rep(c("vac", "con"), each = 2), 12))
set.seed(76153)
a$lung[a$tx == "vac"] <- rnorm(24, 5, 1.3)
a$lung[a$tx == "con"] <- rnorm(24, 7, 1.3)
thismf1 <- MFClusBootHier(lung ~ tx + room / pen / litter, a, nboot = 10000,
                           boot.cluster = TRUE, boot.unit = TRUE, seed = 12345)
thismf1
```

**mfclusboothier-class** *Class mfclusboothier*

## Description

Class mfclusboothier is created from output of function MFClusBootHier.

## Fields

- MFhBoot output from MFhBoot. A list.
- MFnestBoot output from MFnestBoot. A list.

## Author(s)

MF-package

## See Also

[MFhBoot](#), [MFnestBoot](#)

MFClusHier

*MFClusHier*

## Description

Calculate mitigated fraction directly from hierachial nested data. Combines [MFh](#) and [MFnest](#) into a single function.

## Usage

```
MFClusHier(formula, data, compare = c("con", "vac"), which.factor = "All")
```

## Arguments

formula	Formula of the form $y \sim x + a/b/c$ , where $y$ is a continuous response, $x$ is a factor with two levels of treatment, and $a/b/c$ are grouping variables corresponding to the clusters. Nesting is assumed to be in order, left to right, highest to lowest. So a single level of "a" will contain multiple levels of "b" and a single level of "b" will contain multiple levels of "c".
data	a data.frame or tibble with the variables specified in formula. Additional variables will be ignored.
compare	Text vector stating the factor levels - compare[1] is the control or reference group to which compare[2] is compared.
which.factor	one or more variable(s) of interest. This can be any of the core or nest variables from the data set. If none or NULL is specified, MF will be calculated for the whole tree.

**Value**

A list with the following elements:

- MFh: as output from [MFh](#).
- MFnest: as output from [MFnest](#).

**Note**

Core variable is the variable corresponding to the lowest nodes of the hierarchical tree. Nest variables are those above the core. All refers to a summary of the entire tree.

**Author(s)**

  room = paste("Room", rep(c("W", "Z"), each = 24)),
  pen = paste("Pen", rep(LETTERS[1:6], each = 8)),
  litter = paste("Litter", rep(11:22, each = 4)),
  tx = rep(rep(c("vac", "con"), each = 2), 12))
set.seed(76153)
a$lung[a$tx == "vac"] <- rnorm(24, 5, 1.3)
a$lung[a$tx == "con"] <- rnorm(24, 7, 1.3)
thismf <- MFClusHier(lung ~ tx + room / pen / litter, a)
thismf$MFnest
aCore <- thismf$MFh
aCore
aCore$data
aCore$formula
aCore$compare
```

**Description**

Class mfclushier is created from output of function MFClusHier

**Fields**

- MFh: output from MFh. A [mfhierdata](#) object.
- MFnest: output from MFnest. A tibble.

**Author(s)**

[MF-package](#)

**See Also**

[MFh](#), [MFnest](#)

**mfcluster-class**

*Class mfcluster*

**Description**

Class mfcluster is created from output of function MFClus

**Fields**

- All: vector with elements
  - w: Wilcoxon statistic
  - u: Mann-Whitney statistic
  - r: mean ridit
  - n1: size of group 1
  - n2: size of group 2
  - mf: mitigated fraction
- byCluster: As for All, by clusters
- excludedClusters: character vector naming clusters excluded because of missing treatment
- call: the call to MFClus
- compare: character vector naming groups compared

**Author(s)**

[MF-package](#)

**See Also**

[MFClus](#)

**mfcomponents-class**

*Class mfcomponents*

**Description**

Class mfcomponents is created from output of function MFSubj

**Fields**

- mf: numeric estimator for mitigated fraction
- x: numeric vector containing responses of group 1
- y: numeric vector containing responses of group 2
- subj: matrix where mf\_jre the subject components
- compare: character vector naming groups being compared

**Author(s)**[MF-package](#)**See Also**[MFSubj](#)

MFh

*Identify ranks for use when evaluating MF for nested hierarchy.***Description**

Identify ranks for use when evaluating MF for nested hierarchy.

**Usage**

```
MFh(formula, data, compare = c("con", "vac"))
```

**Arguments**

- |         |  |
|---------|--|
| formula | Formula of the form $y \sim x + a/b/c$ , where $y$ is a continuous response, $x$ is a factor with two levels of treatment, and $a/b/c$ are vgrouping variables corresponding to the clusters. Nesting is assumed to be in order, left to right, highest to lowest. So a single level of "a" will contain multiple levels of "b" and a single level of "b" will contain multiple levels of "c". |
| data    | a data.frame or tibble with the variables specified in formula. Additional variables will be ignored.  |
| compare | Text vector stating the factor levels - compare[1] is the control or reference group to which compare[2] is compared.  |

**Value**

A [mfhierdata](#) object, which is a list of three items.

- coreTbl A [dplyr::tibble](#) with one row for each unique core level showing values for:
  - con\_n & vac\_n: counts of observations for each treatment level in the core level.
  - con\_medResp & vac\_medResp: median of the  $y$  continuous response for each treatment level.
  - n1n2: product of the counts,  $con\_n \times vac\_n$ .
  - w: Wilcoxon statistic
  - u: Mann-Whitney statistic
- data: A [dplyr::tibble](#) of the restructured input data used for calculations.
- compare: The compare variables as input by user.
- formula: The formula as input by user.

**Note**

Core variable is the variable corresponding to the lowest nodes of the hierachial tree. Nest variables are those above the core.

**Author(s)**

[MF-package](#)

**See Also**

[MFnest](#) for calculation of MF for nest, core and all variables. [mfhierdata](#) for returned object. [MF-ClusHier](#) for a wrapper.

**Examples**

```
a <- data.frame(
  room = paste("Room", rep(c("W", "Z"), each = 24)),

```

MFhBoot

*MFhBoot*

**Description**

Calculate rank tables for MF using bootstrapping.

**Usage**

```
MFhBoot(
  formula,
  data,
  compare = c("con", "vac"),
  nboot = 10000,
  boot.unit = TRUE,
  boot.cluster = TRUE,
  seed = sample(1:1e+05, 1)
)
```

### Arguments

formula	Formula of the form $y \sim x + a/b/c$ , where $y$ is a continuous response, $x$ is a factor with two levels of treatment, and $a/b/c$ are grouping variables corresponding to the clusters. Nesting is assumed to be in order, left to right, highest to lowest. So a single level of "a" will contain multiple levels of "b" and a single level of "b" will contain multiple levels of "c".
data	a data.frame or tibble with the variables specified in formula. Additional variables will be ignored.
compare	Text vector stating the factor levels - compare[1] is the control or reference group to which compare[2] is compared.
nboot	number of bootstrapping events
boot.unit	Boolean whether to sample observations from within those of the same core.
boot.cluster	Boolean whether to sample which cores are present. If TRUE, some trees have all the cores while others only have a subset.
seed	to initialize random number generator for reproducibility. Passed to set.seed.

### Value

A list with the following elements:

- bootmfh: Rank table for the bootstrapped values as output from [MFh](#). Includes a new bootID variable to distinguish each bootstrapped incidence.
- clusters: Table of unique nodes with an ID.
- compare: Compare vector as specified by user.
- mfh: MFh run on original data input.

```

**mfhierdata-class***Class mfhierdata***Description**

Class mfhierdata is created from output of function MFh

**Fields**

- coreTbl: data.frame with one row for each unique core level showing values for nx, ny, N, w, u, and median observed response.
- data: data.frame is the restructured input data used for calculations in MFh and MFnest.
- compare: character vector naming groups being compared.
- formula: formula that was called by user.

**Author(s)**

[MF-package](#)

[MFh](#)

**mfhlboot-class***Class mfhlboot***Description**

class for data objects produced by HLBoot, contains class mf with additional fields *MFstat*, *HLstat*, *QDIFstat*, *QXstat*, *QYstat*

**Fields**

- nboot: Numeric value specifying number of samples.
- alpha: Numeric value specifying complement of confidence interval.
- seed: Vector of integers specifying seed for pseudo-random number generator used.
- compare: Vector of character strings naming groups compared.
- rng: Character string naming type of random number generator.
- sample: The bootstrapped values.
- MFstat: Matrix with columns *observed*, *median*, *lower*, *upper* for Equal Tailed and Highest Density estimates of mitigated fraction (MF).

- HLstat: Matrix with columns *observed*, *median*, *lower*, *upper* for Equal Tailed and Highest Density estimates of Hodge-Lehmann estimator (HL).
- QDIFstat: Matrix with columns *observed*, *median*, *lower*, *upper* for estimates of Quartile Differences.
- QXstat: Matrix with columns *observed*, *median*, *lower*, *upper* for quartiles of treatments, equal tailed.
- QYstat: Matrix with columns *observed*, *median*, *lower*, *upper* for quartiles of response, equal tailed.

MFmp

*Mitigated fraction from matched pairs*

## Description

Estimates mitigated fraction from matched pairs.

## Usage

```
MFmp(
  formula = NULL,
  data = NULL,
  compare = c("con", "vac"),
  x = NULL,
  alpha = 0.05,
  df = NA,
  tdist = TRUE
)
```

## Arguments

formula	Formula of the form $y \sim x + \text{cluster}(w)$ , where $y$ is a continuous response, $x$ is a factor with two levels of treatment, and $w$ is a factor indicating the clusters.
data	Data frame
compare	Text vector stating the factor levels - <code>compare[1]</code> is the control or reference group to which <code>compare[2]</code> is compared
x	Trinomial vector $\{\Sigma I(x < y), \Sigma I(x = y), \Sigma I(x > y)\}$

<code>alpha</code>	Complement of the confidence level.
<code>df</code>	Degrees of freedom. Default N-2
<code>tdist</code>	Use quantiles of t or Gaussian distribution for confidence interval? Default t distribution.

### Details

Estimates  $MF$  from matched pairs by the difference of multinomial fractions  $(\sum I(x < y) - \sum I(x > y))/N$ . The trinomial vector is  $\{\sum I(x < y), \sum I(x = y), \sum I(x > y)\}$

### Value

a [mfmp](#) data object

### Note

upper confidence interval is truncated to 1; lower confidence interval is truncated to -1. Point estimate of 1.0 indicates complete separation.

### Examples

```
MFmp(les ~ tx + cluster(cage), mlesions, compare = c("con", "vac"))
MFmp(x = c(12, 12, 2))
```

### Description

Class `mfmp` is created from output of function `MFmp`

### Fields

- `ci`: numeric vector of point and interval estimates
- `x`: numeric vector of length three holding data
- `what`: text string describing interval type
- `alpha`: numeric value specifying complement of confidence interval
- `tdist`: Logical indicating if t distribution(TRUE) or Gaussian (FALSE)
- `df`: numeric value indicating degrees freedom

**MFnest**

*Summations to calculate the MF for nested data from a rank table.*

**Description**

Summations to calculate the MF for nested data from a rank table.

**Usage**

```
MFnest(Y, which.factor = "All")
```

**Arguments**

- |                           |   |
|---------------------------|---|
| <code>Y</code>            | rank table (tibble or data.frame), structured as \$coreTbl output from <a href="#">MFh</a> or returned object from <a href="#">MFh</a> .  |
| <code>which.factor</code> | one or more grouping variable(s) of interest. This can be any of the core or nest variables from the data set. If none or All is specified, a summary MF will be calculated for the whole tree. |

**Value**

A tibble with each unique level of a variable as a row. Other values include:

- `MF`: Mitigated fraction for the particular level of the variable in this row.
- `N1N2`: Sum of the `n1n2` variable in \$coreTbl field of `mfhierdata` object output by [MFh](#) for this particular variable-level combination.
- `U`: Sum of `u` variable in \$coreTbl field of `mfhierdata` object output by [MFh](#) for this particular variable-level combination.
- `_N`: Sum of the `_n` variable in \$coreTbl field of `mfhierdata` object output by [MFh](#) for this particular variable-level combination.
- `_medResp`: Median of observed responses for each comparison group for this particular variable-level combination.

**Note**

Core variable is the variable corresponding to the lowest nodes of the hierachial tree. Nest variables are those above the core. All refers to a summary of the entire tree.

```

## Description

*MFnest* using bootstrapping

## Usage

```
MFnestBoot(x, which.factor = "All", alpha = 0.05)
```

## Arguments

x	output from <a href="#">MFhBoot</a>
which.factor	one or more grouping variable(s) of interest. This can be any of the core or nest variables from the data set. A MF value will be calculated for each level of the variable(s) specified. Default is "All", to sum over entire tree.
alpha	Passed to <code>emp_hpd</code> to calculate eq tailed upper and high lower of mitigated fraction

## Value

A list with the following elements:

- `mfnest_details`: The MF and summary statistics as calculated for each bootstrap event. Variables as in [MFnest](#) output.
- `mfnest_summary`: Statistical summary of bootstrapped MF with each unique level of a core or nest variable passed to `which.factor` as a row. Other variables include:
  - median: Median of MFs from all of the bootstrap events.
  - etlower: Lower value of equal tailed range.
  - etupper: Upper value of equal tailed range.
  - hdlower: Lower value of the highest posterior density range.
  - hdupper: Upper value of the highest posterior density range.
  - mf.obs: MF calculated from data using [MFh](#).

**MFr***Mitigated fraction***Description**

Mitigated fraction comparing treatment to control.

**Usage**

```
MFr(formula, data, compare = c("con", "vac"))
```

**Arguments**

<b>formula</b>	Formula of the form $y \sim x$ , where $y$ is a continuous response and $x$ is a factor with two levels
<b>data</b>	Data frame
<b>compare</b>	Text vector stating the factor levels – <code>compare[1]</code> is the control or reference group to which <code>compare[2]</code> is compared

**Details**

The mitigated fraction is an estimator that quantifies an intervention's effect on reducing the severity of a condition. Since its units are on the probability scale, it is often a good idea to accompany it with an estimator on the original scale of measurement.

**Value**

The estimated mitigated fraction.

**Author(s)**

[MF-package](#)

**References**

Siev D, 2005. An estimator of intervention effect on disease severity. *Journal of Modern Applied Statistical Methods*. 4:500-508

**Examples**

```
MFr(lesion ~ group, calflung)
# [1] 0.44
```

MFSubj

*Subject components of mitigated fraction*

**Description**

Estimates the subject components of the mitigated fraction.

**Usage**

```
MFSubj(formula, data, compare = c("con", "vac"))
```

**Arguments**

formula	Formula of the form $y \sim x$ , where $y$ is a continuous response and $x$ is a factor with two levels
data	Data frame
compare	Text vector stating the factor levels - compare[1] is the control or reference group to which compare[2] is compared

**Details**

The mitigated fraction is an estimator that quantifies an intervention's effect on reducing the severity of a condition. Since its units are on the probability scale, it is often a good idea to accompany it with an estimator on the original scale of measurement.

The subject components are the individual contributions of the treated subjects to  $MF$ , which is the average of the subject components.

**Value**

a [mfcomponents](#) data object

### Examples

```
x <- MFSubj(lesion ~ group, calflung)
x

# MF = 0.44 comparing vac to con
#
# MF Subject Components
#
#   mf_j freq   min_y   max_y
#   1.00   6 0.000030 0.00970
#   0.84   1 0.012500 0.01250
#   0.76   3 0.016650 0.02030
#   0.68   6 0.023250 0.03190
#   0.04   1 0.132100 0.13210
#  -0.04   3 0.144575 0.16325
#  -0.20   2 0.210000 0.21925
#  -0.36   1 0.292000 0.29200
#  -0.52   1 0.356500 0.35650
#  -0.84   1 0.461500 0.46150

mean(x$subj[, "mf_j"])

# [1] 0.44
```

mlesions

*mlesions dataset*

### Description

Post-mortem examination of the lungs of dogs housed in cages by pairs.

### Format

A data frame with 52 observations of the following 3 variables, no NAs.

- cage: Cage ID. 1 - 26.
- tx: Treatment. One of "con" or "vac".
- les: Percent gross lung lesions.

piglung

*piglung dataset*

### Description

Post-mortem examination of the lungs of pigs in litters.

**Format**

A data frame with 102 observations of the following 3 variables, no NAs.

- **lesion**: Percent gross lung lesions.
- **group**: Treatment group. One of "con" or "vac".
- **litter**: Litter ID.
